

Concurrent vs. dedicated training at a matched 150,000-simulation budget

Palisades (65,569 of 150,000 episodes concurrent)

Pyrenees (84,431 of 150,000 episodes concurrent)

2,000-episode moving average of the binary escape indicator; labels give the mean over each run's final 20,000 episodes. 5 seaplanes + 5 eVTOLs, switch-ignition-4, directional-2 (K=3). Lower is better. Palisades: the two are indistinguishable. Pyrenees: concurrent is 1.0 point worse ($z = 2.4$).
